- The information, applied circuit, program, usage etc., written in this material is just for reference. Epson Toyocom does not assume any liability for the occurrence of infringing any patent or copyright of a third party. This material does not authorize the licensing for any patent or intellectual copyrights.
- Any product described in this material may contain technology or the subject relating to strategic products under the control of the Foreign Exchange and Foreign Trade Law of Japan and may require an export licence from the Ministry of International Trade and industry or other approval from another government agency.
- You are requested not to use the products (and any technical information furnished, if any) for the development and/or manufacture of weapon of mass destruction or for other military purposes. You are also requested that you would not make the products available to any third party who may use the products for such prohibited purposes.
- These products are intended for general use in electronic equipment. When using them in specific applications that require extremely high reliability such as applications stated below, it is required to obtain the permission from Epson Toyocom in advance.
 - / Space equipment (artificial satellites, rockets, etc) / Transportation vehicles and related (automobiles, aircraft, trains, vessels, etc) / Medical instruments to sustain life / Submarine transmitters
 - / Power stations and related / Fire work equipment and security equipment / traffic control equipment
 - / and others requiring equivalent reliability.
- In this manual for Epson Tyocom, product code and marking will still remain as previously identified prior to the merger. Due to the on going strategy of gradual unification of part numbers, please review product code and marking as they will change during the course of the coming months. We apologize for the inconvenience, but we will eventually have a unified part numbering system for Epson Toyocom which will be user friendly.

32-kHz Output Serial RTC Module

RTC - 4543 SA/SB

- Built-in crystal permits operation without requiring adjustment
- Built-in time counters (seconds, minutes, hours) and calendar counters (days, days of the week months, years)
- Operating voltage range: 2.5 V to 5.5 V
- Supply voltage detection voltage: 1.7 ±0.3 V
- Low current consumption: 1.0 µA/2.0 V (Max.)
- Automatic processing for leap years
- Output selectable between 32.768 kHz/1 Hz

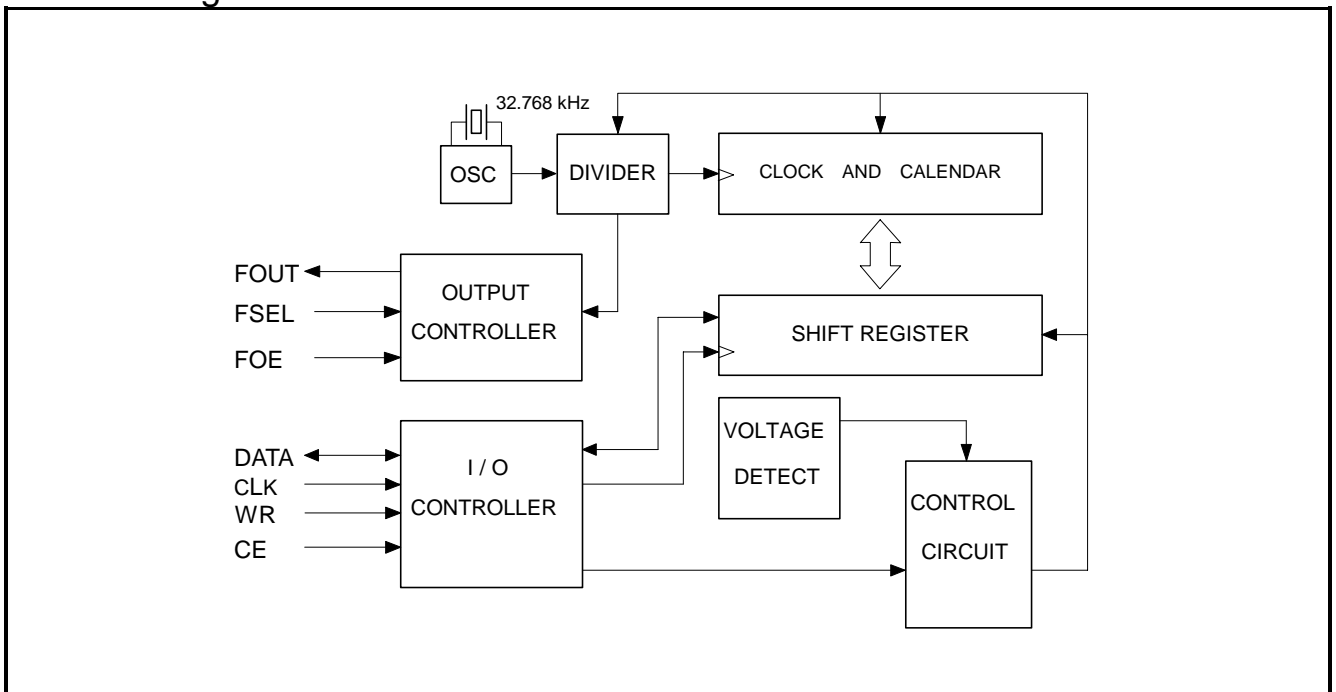

1. Overview

This module is a real-time clock with a serial interface and a built-in crystal oscillator. This module is also equipped with clock and calendar circuits, an automatic leap year compensation function, and a supply voltage detection function.

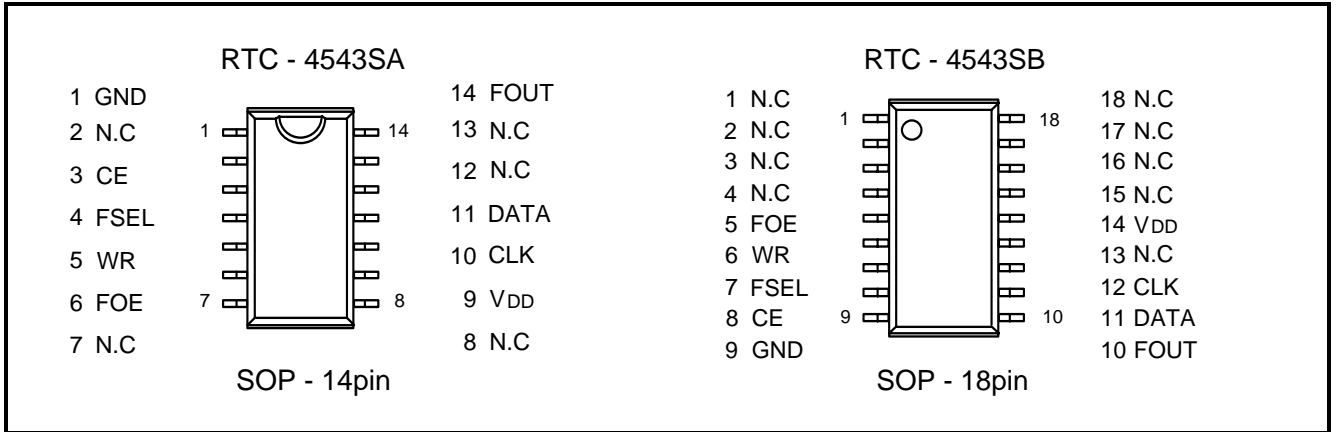

In addition, this module has a 32.768 kHz/1 Hz selectable output function for hardware control that is independent of the RTC circuit.

This module is available in a compact SOP 14-pin package (RTC-4543SA) and a thin SOP 18-pin package (RTC-4543SB).

2. Block diagram

3. Pin Connections

4. Pin Functions

Signal	Pin No. SOP-14pin (SOP-18pin)	I/O	Function
GND	1 (9)		Connects to negative (-) side (ground) of the power supply.
CE	3 (8)	Input	Chip enable input pin. When high, the chip is enabled. When low, the DATA pin goes to high impedance and the CLK, DATA, and WR pins are not able to accept input. In addition, when low, the TM bit is cleared.
FSEL	4 (7)	Input	Select the frequency that is output from the FOUT pin. High : 1 Hz Low : 32.768 kHz
WR	5 (6)	Input	DATA pin input/output switching pin. High : DATA input (when writing the RTC) Low : DATA output (when reading the RTC)
FOE	6 (5)	Input	When high, the frequency selected by the FSEL pin is output from the FOUT pin. When low, the FOUT pin goes to high impedance.
VDD	9 (14)		Connects to positive (+) side of the power supply.
CLK	10 (12)	Input	Serial clock input pin. Data is gotten at the rising edge during a write, and data is output at the rising edge during a read.
DATA	11 (11)	Bi-directional	Input/output pin that is used for writing and reading data.
FOUT	14 (10)	Output	Outputs the frequency selected by the FSEL pin. 1 Hz output is synchronized with the internal one-second signal. This output is not affected by the CE pin.
N.C.	2,7,8,12,13 (1,2,3,4,13, 15,16,17,18)		Although these pins are not connected internally, they should always be left open in order to obtain the most stable oscillation possible.

* Always connect a passthrough capacitor of at least 0.1 μF as close as possible between VDD and GND.

5. Electrical Characteristics

5-1. Absolute Maximum Ratings

Item	Symbol	Conditions	Min.	Max.	Unit
Supply voltage	VDD	Ta=+25 °C	-0.3	7.0	V
Input voltage	VI		GND-0.3	VDD+0.3	V
Output voltage	VO		GND-0.3	VDD+0.3	V
Storage temperature	TSTG	-	-55	+125	°C

5-2. Operating Condition

Item	Symbol	Conditions	Min.	Max.	Unit
Operating supply voltage	VDD	-	2.5	5.5	V
Data holding voltage	VCLK	-	1.4	5.5	V
Operating temperature	TOPR	No condensation	-40	+85	°C

5-3. Frequency Characteristics

Item	Symbol	Conditions	Max.	Unit
Frequency tolerance	$\Delta f/f_0$	Ta=+25 °C , VDD=5.0 V	5 ± 23 *	$\times 10^{-6}$
Frequency temperature characteristics	Top	-10to+70 °C +25 °C ref	+ 10 / - 120	$\times 10^{-6}$
Frequency voltage characteristics	f/V	Ta=+25 °C , VDD=2.0 to 5.5 V	± 2	$\times 10^{-6}/V$
Oscillation start time	tSTA	Ta=+25 °C , VDD=2.5 V	3	s
Aging	fa	Ta=+25 °C , VDD=5 V , first year	± 5	$\times 10^{-6}$

* Monthly deviation: Approx. 1 min.

5-4. DC Characteristics

Unless specified otherwise: VDD = 5 V ± 10 %, Ta = - 40 to +85 °C

Item	Symbol	Conditions	Min.	Typ.	Max.	Unit
Current consumption(1)	IDD1	VDD=5.0 V CE=L , FOE=L		1.5	3.0	μA
Current consumption(2)	IDD2	VDD=3.0 V FSEL=H		1.0	2.0	μA
Current consumption(3)	IDD3	VDD=2.0 V		0.5	1.0	μA
Current consumption(4)	IDD4	VDD=5.0 V CE=L , FOE=H		4.0	10.0	μA
Current consumption(5)	IDD5	VDD=3.0 V FSEL=L		2.5	6.5	μA
Current consumption(6)	IDD6	VDD=2.0 V No load on the FOUT pin		1.5	4.0	μA
Input voltage	VIH	WR,DATA,CE,CLK, FOE,FSEL pins	0.8 VDD			V
	VIL				0.2 VDD	V
Input off/leak current	I _{OFF}	WR,CE,CLK,FOE,FSEL pins VIN = VDD or GND			0.5	μA
Output voltage	VOH(1)	VDD=5.0 V IOH=-1.0 mA	4.5			V
	VOH(2)	VDD=3.0 V DATA , FOUT pins	2.0			V
	VOL(1)	VDD=5.0 V IOL= 1.0 mA			0.5	V
	VOL(2)	VDD=3.0 V DATA , FOUT pins			0.8	V
Output load condition (fanout)	N / CL	FOUT pin	2 LSTTL / 30 pF Max.			
Output leak current	IOZH	VOUT=5.5 V DATA , FOUT pins	-1.0		1.0	μA
	IOZL	VOUT=0 V DATA , FOUT pins	-1.0		1.0	μA
Supply voltage detection voltage	VDT	-	1.4	1.7	2.0	V

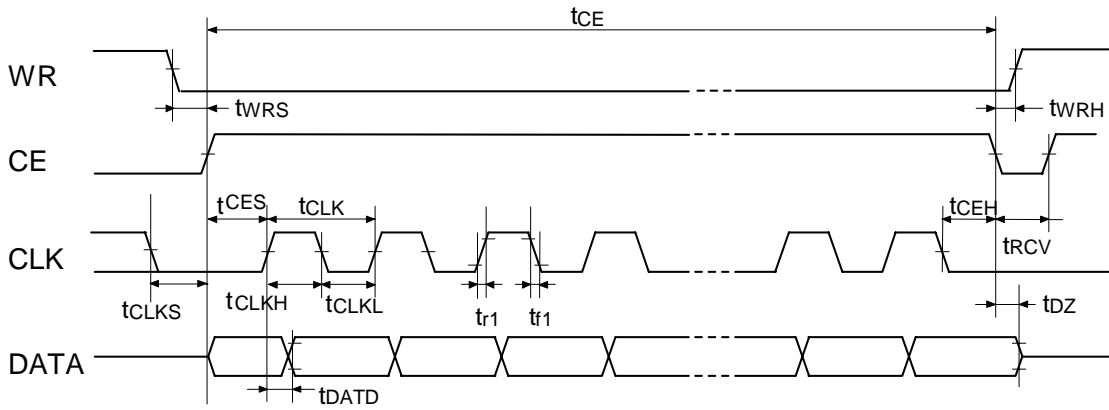

5-5. AC Characteristics

Unless specified otherwise: Ta = - 40 to +85 °C, CL = 50 pF

Item	Symbol	VDD=5 V ± 10 %		VDD=3 V ± 10 %		Unit
		Min.	Max.	Min.	Max.	
CLK clock cycle	tCLK	0.75	7800	1.5	7800	μs
CLK low pulse width	tCLKL	0.375	3900	0.75	3900	μs
CLK high pulse width	tCLKH	0.375	3900	0.75	3900	μs
CLK setup time	tCLKS	25		50		ns
CE setup time	tCES	0.375	3900	0.75	3900	μs
CE hold time	tCEH	0.375		0.75		μs
CE enable time	tCE		0.9		0.9	s
Write data setup time	tSD	0.1		0.2		μs
Write data hold time	tHD	0.1		0.1		μs
WR setup time	tWRS	100		100		ns
WR hold time	tWRH	100		100		ns
DATA output delay time	tDATD		0.2		0.4	μs
DATA output floating time	tDZ		0.1		0.2	μs
Clock input rise time	tr1		50		100	ns
Clock input fall time	tf1		50		100	ns
FOUT rise time (CL=30 pF)	tr2		100		200	ns
FOUT fall time (CL=30 pF)	tf2		100		200	ns
Disable time (CL=30 pF)	txz		100		200	ns
Enable time (CL=30 pF)	tzx		100		200	ns
FOUT duty ratio (CL=30 pF)	Duty	40	60	40	60	%
Wait time	tRCV	0.95		1.9		μs

5-6. Timing Charts

(1) Data read

(2) Data write

(3) FOUT output

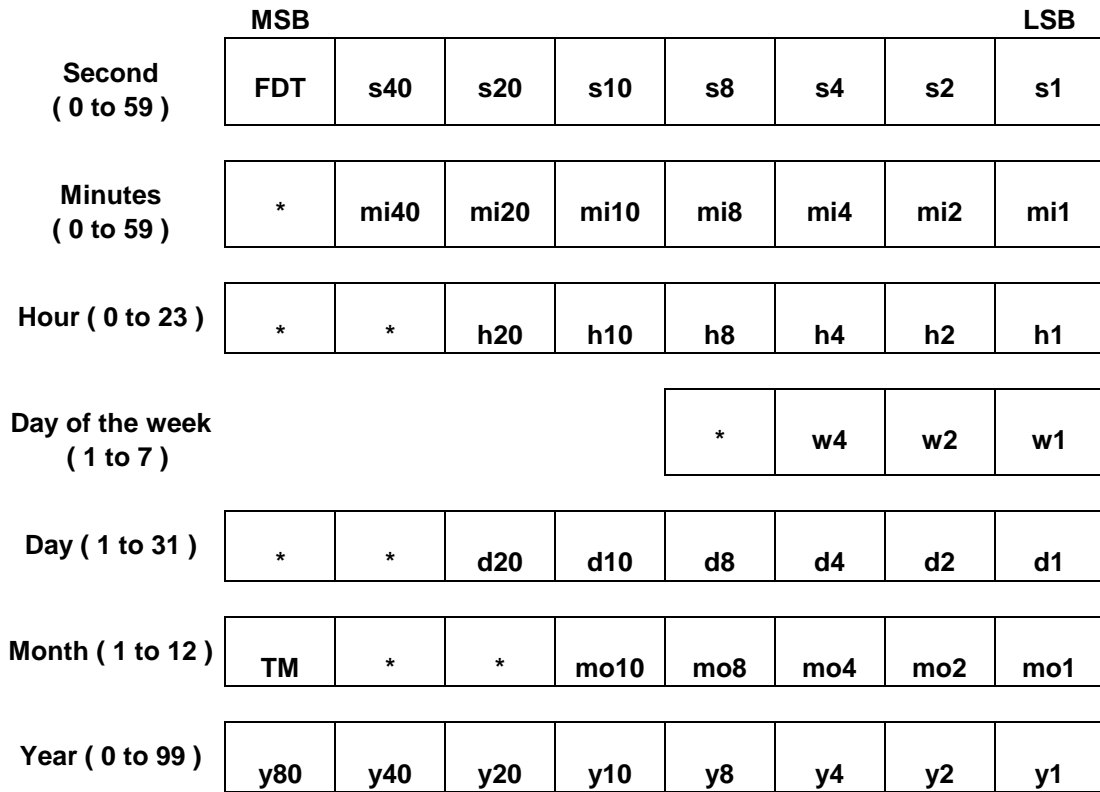

$$\text{Duty} = \frac{t_H}{t} \times 100 \text{ [%]}$$

(4) Disable/enable

6. Timer Data Organization

- The counter data is BCD code.
- The timer automatically adjusts for different month lengths and for leap year.
- The time is indicated in 24-hour format.
- Writes and reads are both performed on an LSB-first basis.

* bits: Any data may be written to these bits.

- FDT bit: Supply voltage detection bit
 - This bit is set to “1” when voltage of 1.7 ± 0.3 V or less is detected between VDD and GND.
 - The FDT bit is cleared if all of the digits up to the year digits are read.
 - Although this bit can be both read and written, normally set this bit to “0”.

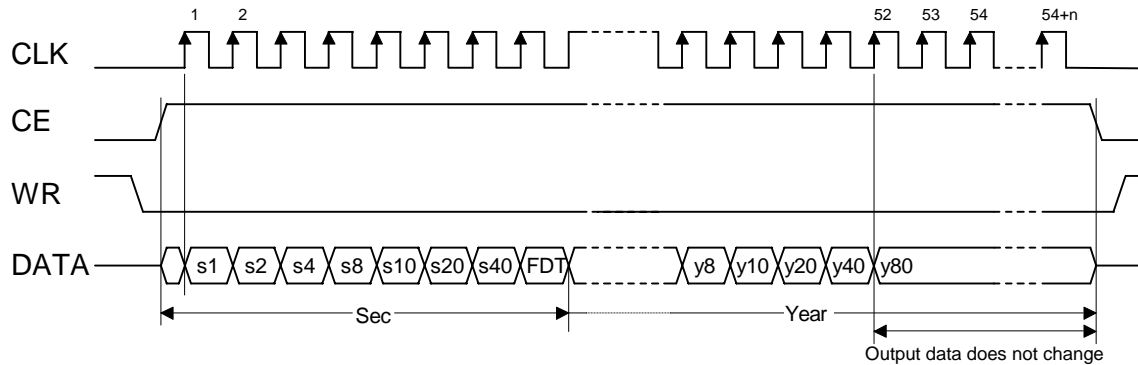

The supply voltage detection circuit monitors the supply voltage once every 0.5 seconds; if the supply voltage is lower than the detection voltage value, the FDT bit is set to “1”.

- TM bit: This is a test bit for SEIKO-EPSON's use. Always set this bit to “0”.

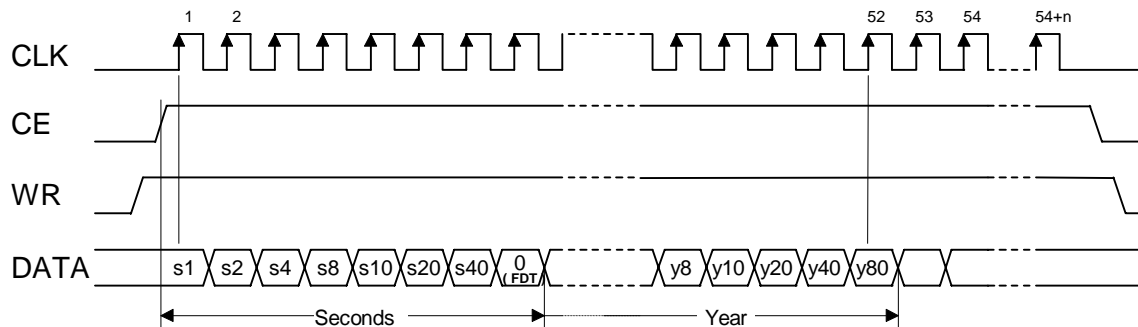

7. Description of Operation

7-1. Data reads

- 1) When the WR pin is low and the CE pin is high, the RTC enters data output mode.
- 2) At the first rising edge of the CLK signal, the clock and calendar data are loaded into the shift register and the LSB of the seconds digits is output from the DATA pin.
- 3) The remaining seconds, minutes, hour, day of the week, day, month, and year data is shifted out, in sequence and in synchronization with the rising edge of the CLK signal, so that the data is output from the DATA pin.
The output data is valid until the rising edge of the 52nd clock pulse; even if more than 52 clock pulses are input, the output data does not change.
- 4) If data is required in less than 52 clock pulses, that part of the data can be gotten by setting the CE pin low after the necessary number of clock pulses have been output.
Example: If only the data from “seconds” to “day of the week” is needed:
After 28 clock pulses, set the CE pin low in order to get the data from “seconds” to “day of the week.”
- 5) When performing successive data read operations, a wait (tRCV) is necessary after the CE pin is set low.
- 6) Note that if an update operation (a one-second carry) occurs during a data read operation, the data that is read will have an error of -1 second.
- 7) Complete data read operations within tCE (Max.) = 0.9 seconds, as described earlier.

7-2. Data writes

- 1) When the WR pin is high and the CE pin is high, the RTC enters data input mode.
- 2) In this mode, data is input, in succession and in synchronization with the rising edge of the CLK signal, to the shift register from the DATA pin, starting from the LSB of the seconds digits.
- 3) The sub-seconds counter is reset between the falling edge of the first clock pulse and the rising edge of the second clock pulse. In addition, carries to the seconds counter are prohibited at the falling edge of the first clock pulse.
- 4) After the last data is input to the shift register at the rising edge of the 52nd clock pulse, the contents of the shift register are transferred to the timer counter.
- 5) Note that during a data write operation, 52 bits of data must be input.
 - Correct write-access isn't completed when CE terminal turned into low on a state of less than 52 bits.
 - If more than 52 bits of data are input, the 53rd and subsequent bits are ignored. (The first 52 bits of data are valid.)
- 6) Once the CE pin is set low, the prohibition on carries to the seconds counter is lifted. Complete data write operations within tCE (Max.) = 0.9 seconds, as described earlier.
- 7) If a data read operation is to be performed immediately after a data write operation, a wait (tRCV) is necessary after the CE pin is set low.

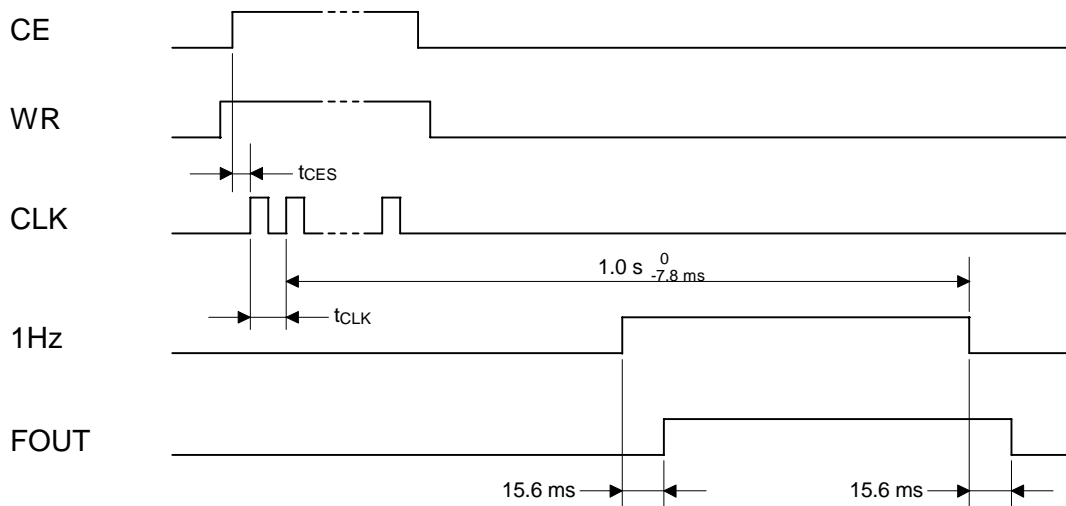

* Malfunction will result if illegal data is written. Therefore, be certain to write legal data.

7-3. Data writes (Divider Reset)

After the counter is reset, carries to the seconds digit are halted. After the data write operation, the prohibition on carries to the seconds counter is lifted by setting the CE pin low. Complete data write operations within t_{CE} (Max.) = 0.9 seconds, as described earlier.

7-4. FOUT output and 1 Hz carries

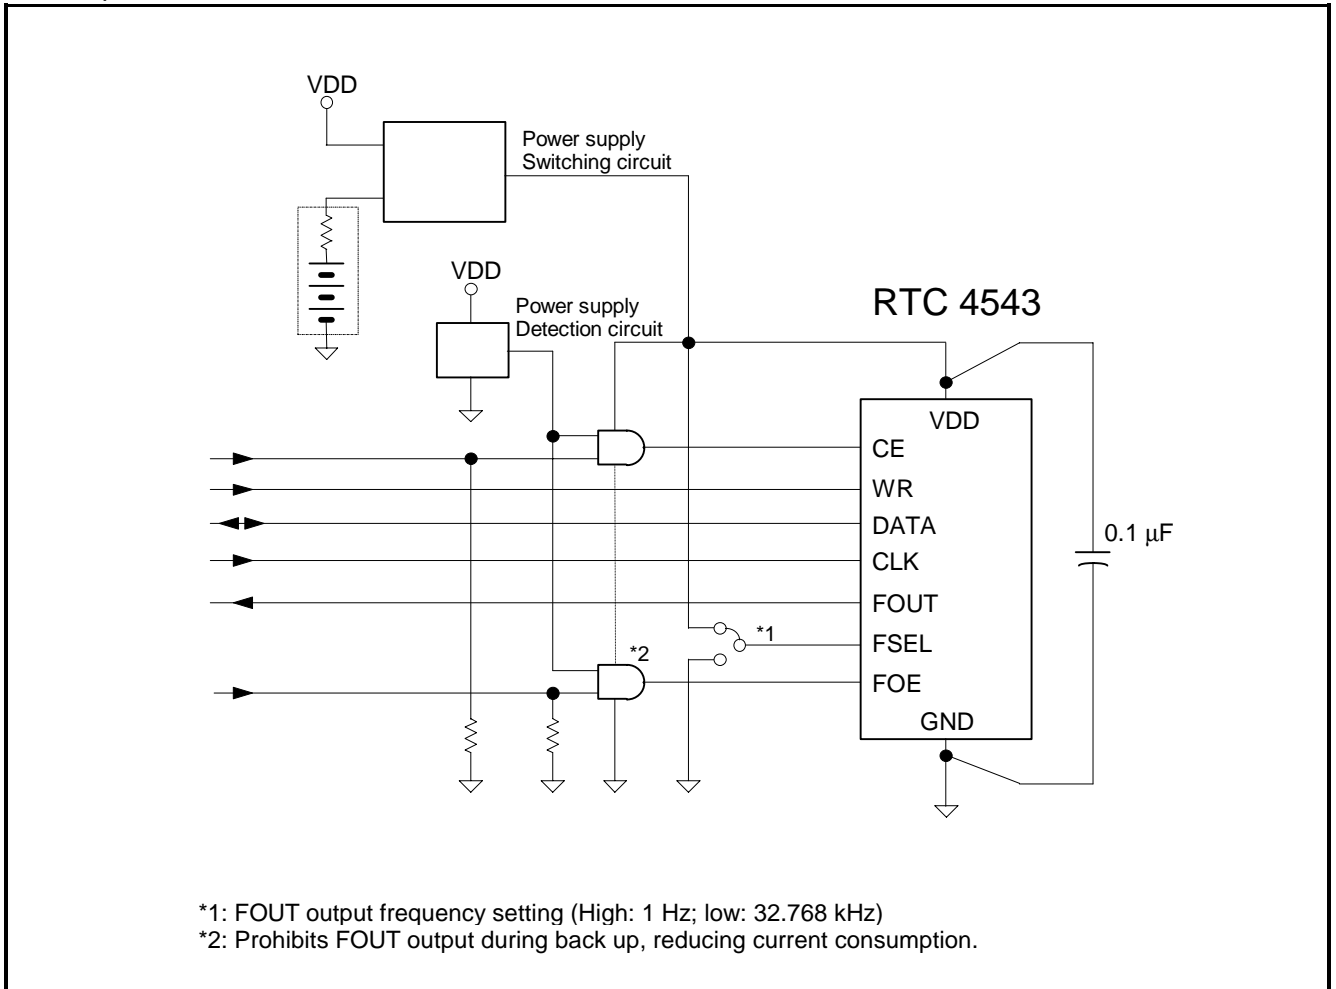

During a data write operation, because a reset is applied to the Divider counter (from the 128 Hz level to the 1 Hz level) after the CE pin goes high during the time between the falling edge of the first clock cycle and the rising edge of the second clock cycle, the length of the first 1 Hz cycle after the data write operation is $1.0 \text{ s}^{+0 / -7.8\text{ms}} + t_{CES} + t_{CLK}$. Subsequent cycles are output at 1.0-second intervals.

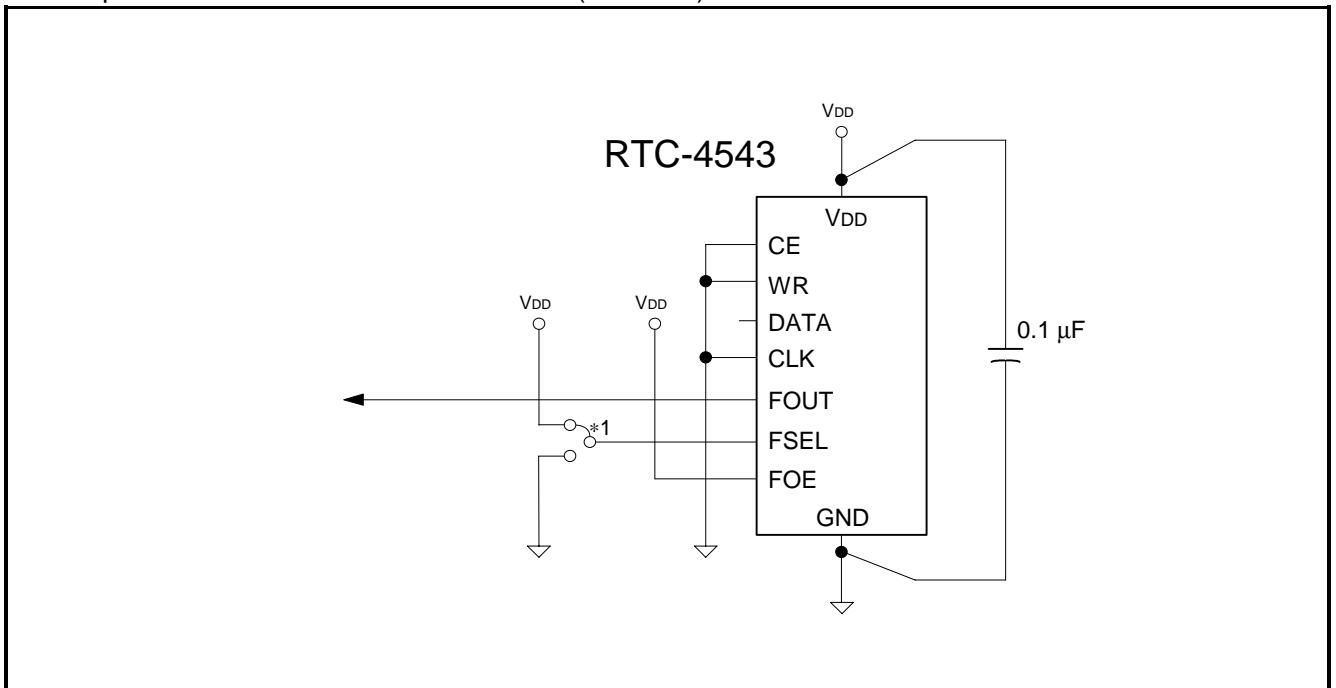

The 1-Hz signal that is output on FOUT is the internal 1-Hz signal with a 15.6-ms shift applied.

8. Examples of External Circuits

- Example 1. When used as an RTC + clock source

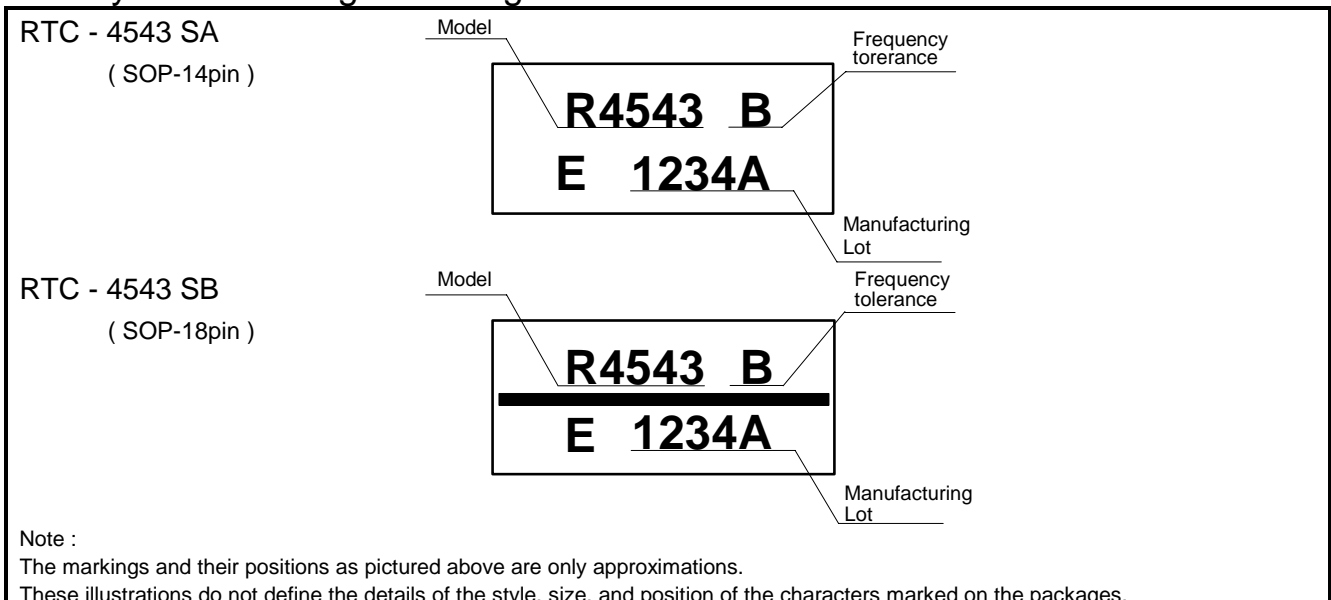

- Example 2. When used as a clock source (oscillator)

9. External Dimensions

10. Layout of Package Markings

11. Reference Data

(1) Example of Frequency-Temperature Characteristics

$\theta_T = +25 \text{ }^\circ\text{C Typ.}$

$\alpha = -0.035 \times 10^{-6} / \text{ }^\circ\text{C}^2 \text{ Typ.}$

Determining the frequency stability (clock accuracy)

1. The frequency-temperature characteristics can be approximated by the following equation:

$$\Delta f_T = \alpha(\theta_T - \theta_x)^2$$

- Δf_T : Frequency deviation at any given temperature
- $\alpha (/^\circ\text{C}^2)$: Second-order temperature $((-0.035 \pm 0.005) \times 10^{-6} / ^\circ\text{C}^2)$
- $\theta_T (^\circ\text{C})$: Highest temperature (+25 °C ± 5 °C)
- $\theta_x (^\circ\text{C})$: Any given temperature

2. In order to determine the clock accuracy, add in the frequency tolerance and the voltage characteristics.

$$\Delta f/f = \Delta f/f_0 + \Delta f_T + \Delta f_v$$

- $\Delta f/f$: Clock accuracy at any given temperature and voltage (frequency stability)
- $\Delta f/f_0$: Frequency accuracy
- Δf_T : Frequency deviation at any given temperature
- Δf_v : Frequency deviation at any given voltage

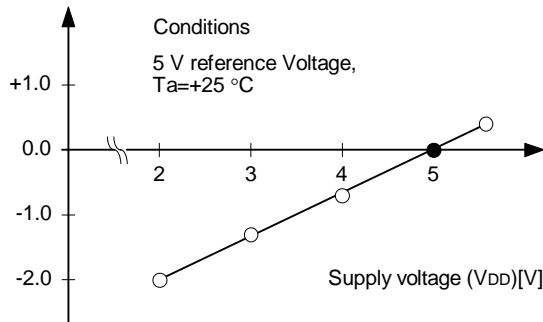

3. Determining the daily error

$$\text{Daily error} = \Delta f/f \times 86400 \text{ (seconds)}$$

With error of 11.574×10^{-6} , the error of the clock is about one second per day.

(2) Example of Frequency-Voltage Characteristics

Frequency [x 10⁻⁶]

(3) Example of Current Consumption-Voltage Characteristics

Current consumption [μA]

Note : This data shows values obtained from a sample lot.

12. Application notes

1) Notes on handling

This module uses a C-MOS IC to realize low power consumption. Carefully note the following cautions when handling.

(1) Static electricity

While this module has built-in circuitry designed to protect it against electrostatic discharge, the chip could still be damaged by a large discharge of static electricity. Containers used for packing and transport should be constructed of conductive materials. In addition, only soldering irons, measurement circuits, and other such devices which do not leak high voltage should be used with this module, which should also be grounded when such devices are being used.

(2) Noise

If a signal with excessive external noise is applied to the power supply or input pins, the device may malfunction or "latch up." In order to ensure stable operation, connect a filter capacitor (preferably ceramic) of greater than 0.1 μF as close as possible to the power supply pins (between VDD and GNDs). Also, avoid placing any device that generates high level of electronic noise near this module.

* Do not connect signal lines to the shaded area in the figure shown in Fig. 1 and, if possible, embed this area in a GND land.

(3) Voltage levels of input pins

When the input pins are at the mid-level, this will cause increased current consumption and a reduced noise margin, and can impair the functioning of the device. Therefore, try as much as possible to apply the voltage level close to VDD or GND.

(4) Handling of unused pins

Since the input impedance of the input pins is extremely high, operating the device with these pins in the open circuit state can lead to unstable voltage level and malfunctions due to noise. Therefore, pull-up or pull-down resistors should be provided for all unused input pins.

2) Notes on packaging

(1) Soldering heat resistance

If the temperature within the package exceeds +260 $^{\circ}\text{C}$, the characteristics of the crystal oscillator will be degraded and it may be damaged. The reflow conditions within our reflow profile is recommended. Therefore, always check the mounting temperature and time before mounting this device. Also, check again if the mounting conditions are later changed.

* See Fig. 2 profile for our evaluation of Soldering heat resistance for reference.

(2) Mounting equipment

While this module can be used with general-purpose mounting equipment, the internal crystal oscillator may be damaged in some circumstances, depending on the equipment and conditions. Therefore, be sure to check this. In addition, if the mounting conditions are later changed, the same check should be performed again.

(3) Ultrasonic cleaning

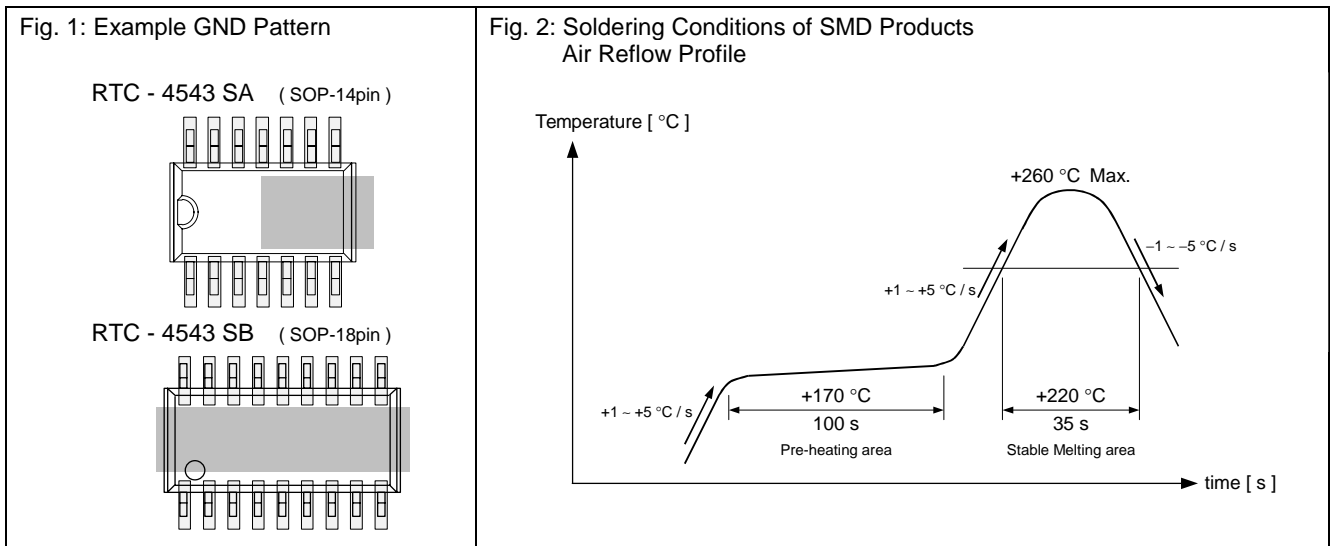

Depending on the usage conditions, there is a possibility that the crystal oscillator will be damaged by resonance during ultrasonic cleaning. Since the conditions under which ultrasonic cleaning is carried out (the type of cleaner, power level, time, state of the inside of the cleaning vessel, etc.) vary widely, this device is not warranted against damage during ultrasonic cleaning.

(4) Mounting orientation

This device can be damaged if it is mounted in the wrong orientation. Always confirm the orientation of the device before mounting.

(5) Leakage between pins

Leakage between pins may occur if the power is turned on while the device has condensation or dirt on it. Make sure the device is dry and clean before supplying power to it.
